

Search trajectory: proposal quality before and after a logged failure mode was corrected

Each run seeds from its predecessor's converged graph. The per-iteration logs made the first failure mode explicit: every final_05 proposal replaced the incumbent model outright and lost. Additive search guidance fixed that in final_06. final_07 then closed a representational gap — seed bagging needs three coordinated edits, and a one-patch action space could not express it — after which the agent used it on its first iteration, reaching 0.605150, +0.003682 over the official baseline. No scored run had any manual intervention.
